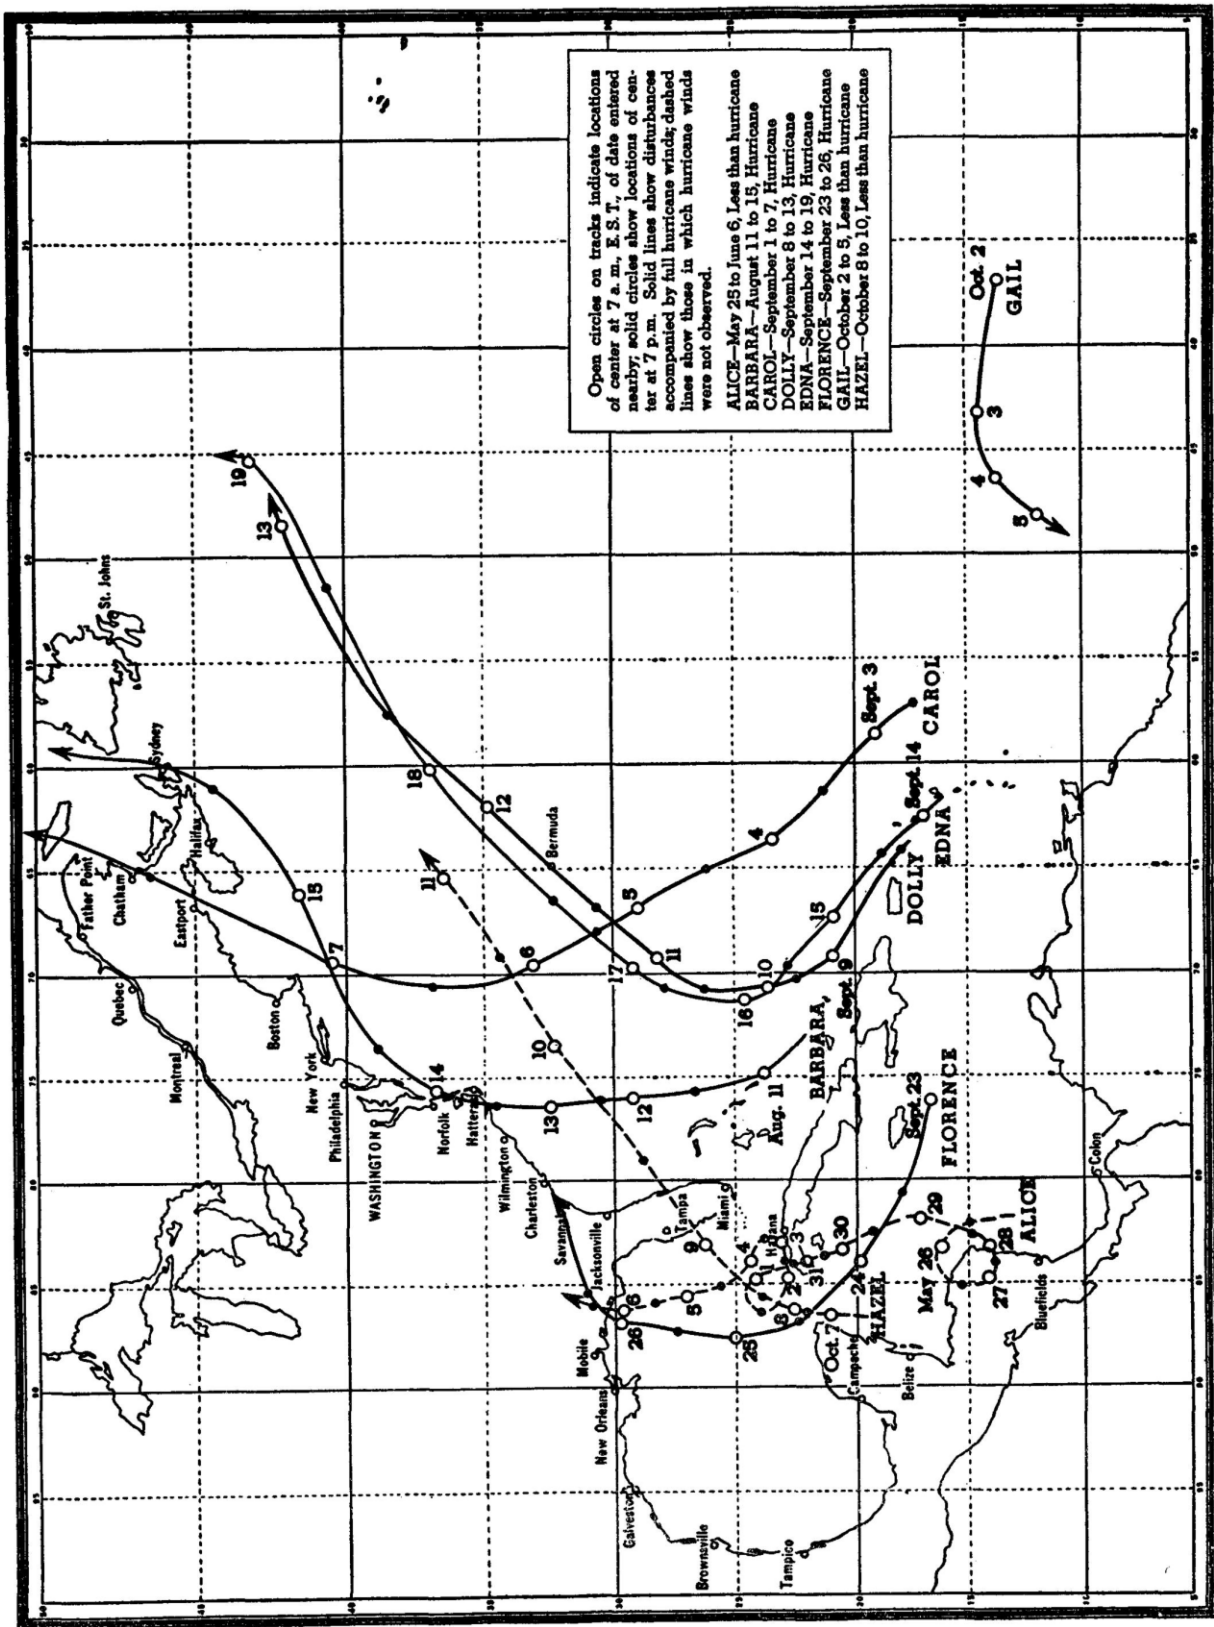

FIGURE 1.—Tracks of hurricanes which occurred during 1963.

Edna, September 14-19.—Following closely behind Dolly, Edna began forming in a squally wave over and to the north of the Leeward Islands on September 14. On the morning of the 15th the center was first definitely located at about 20° N., 66° W. Thereafter the storm strengthened rapidly to a hurricane with strongest wind about 125 m. p. h. and followed a broad curve to north and northeast that very closely paralleled the course taken by Dolly a few days earlier. The center passed a short distance to the north of Bermuda during the evening of the 17th and gave winds in gusts up to 120 m. p. h. which caused considerable damage on the Island.
